Suppose an unknown body S is immersed in a fluid, and the body and the fluid are contained in a fixed domain Ω . Assume Γ is a non empty open subset of $\partial\Omega$ where we can measure $\sigma(\mathbf{u}, p) \mathbf{n}_{|\Gamma}$, at some time $t_0 > 0$.

Is it possible to recover S?.

We assume that the structure is a rigid body so that it can be described by its center of mass $\mathbf{a}(t) \in \mathbb{R}^3$ and by its orientation $\mathbf{Q}(t) \in SO_3(\mathbb{R})$:

$$\mathcal{S}(t) := \mathcal{S}(\mathbf{a}(t), \mathbf{Q}(t)),$$

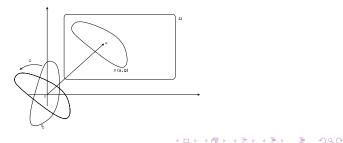

with

$$\mathcal{S}(\mathsf{a},\mathsf{Q}) := \mathsf{Q}\mathcal{S}_0 + \mathsf{a}.$$

and

$$\mathcal{F}(\mathsf{a},\mathsf{Q}) := \Omega \setminus \overline{\mathcal{S}(\mathsf{a},\mathsf{Q})} = \mathcal{F}(\mathsf{a}(t),\mathsf{Q}(t))$$

is a smooth non empty domain.

$$\begin{aligned} -\operatorname{div}(\boldsymbol{\sigma}(\mathbf{u},\boldsymbol{\rho})) &= \mathbf{0} \quad \text{in } \mathcal{F}(t), \quad t \in (0,T), \\ \operatorname{div}(\mathbf{u}) &= \mathbf{0} \quad \text{in } \mathcal{F}(t), \quad t \in (0,T), \end{aligned}$$

$$\begin{aligned} -\operatorname{div}(\boldsymbol{\sigma}(\mathbf{u},p)) &= \mathbf{0} \quad \text{in } \mathcal{F}(t), \quad t \in (0,T), \\ \operatorname{div}(\mathbf{u}) &= \mathbf{0} \quad \text{in } \mathcal{F}(t), \quad t \in (0,T), \end{aligned}$$
$$\mathbf{u} &= \boldsymbol{\ell} + \boldsymbol{\omega} \times (\mathbf{x} - \mathbf{a}) \quad \text{on } \partial \mathcal{S}(t), \quad t \in (0,T), \\ \mathbf{u} &= \mathbf{u}_* \quad \text{on } \partial \Omega, \quad t \in (0,T), \end{aligned}$$

$$-\operatorname{div}(\boldsymbol{\sigma}(\mathbf{u}, p)) = \mathbf{0} \quad \text{in } \mathcal{F}(t), \quad t \in (0, T),$$
$$\operatorname{div}(\mathbf{u}) = \mathbf{0} \quad \text{in } \mathcal{F}(t), \quad t \in (0, T),$$
$$\mathbf{u} = \boldsymbol{\ell} + \boldsymbol{\omega} \times (\mathbf{x} - \mathbf{a}) \quad \text{on } \partial \mathcal{S}(t), \quad t \in (0, T),$$
$$\mathbf{u} = \mathbf{u}_{*} \quad \text{on } \partial \Omega, \quad t \in (0, T),$$
$$\int_{\partial \mathcal{S}(t)} \boldsymbol{\sigma}(\mathbf{u}, p) \mathbf{n} \ d\boldsymbol{\gamma}_{\mathbf{x}} = \mathbf{0} \quad t \in (0, T),$$
$$\int_{\partial \mathcal{S}(t)} (\mathbf{x} - \mathbf{a}) \times \boldsymbol{\sigma}(\mathbf{u}, p) \mathbf{n} \ d\boldsymbol{\gamma}_{\mathbf{x}} = \mathbf{0} \quad t \in (0, T),$$

・ロト ・ 画 ・ ・ 画 ・ ・ 画 ・ うへで

 $-\operatorname{div}(\boldsymbol{\sigma}(\mathbf{u},p)) = \mathbf{0}$ in $\mathcal{F}(t), t \in (0,T),$ $\operatorname{div}(\mathbf{u}) = 0$ in $\mathcal{F}(t)$, $t \in (0, T)$, $\mathbf{u} = \boldsymbol{\ell} + \boldsymbol{\omega} \times (\mathbf{x} - \mathbf{a}) \text{ on } \partial \mathcal{S}(t), \quad t \in (0, T),$ $\mathbf{u} = \mathbf{u}_*$ on $\partial \Omega$, $t \in (0, T)$, $\int_{\partial S(t)} \boldsymbol{\sigma}(\mathbf{u}, p) \mathbf{n} \ d\boldsymbol{\gamma}_{\mathbf{x}} = \mathbf{0} \quad t \in (0, T),$ $\int_{\partial S(t)} (\mathbf{x} - \mathbf{a}) \times \boldsymbol{\sigma}(\mathbf{u}, p) \mathbf{n} \ d\boldsymbol{\gamma}_{\mathbf{x}} = \mathbf{0} \quad t \in (0, T),$ $\mathbf{a}' = \boldsymbol{\ell} \quad t \in (0, T).$ $\mathbf{Q}' = \mathbb{S}(\boldsymbol{\omega})\mathbf{Q} \quad t \in (0, T), \quad (\mathbb{S}(\boldsymbol{\omega})\mathbf{z} = \boldsymbol{\omega} \times \mathbf{z}, \ \forall \mathbf{z} \in \mathbb{R}^3)$ $a(0) = a_0$ $Q(0) = Q_0.$

< ロ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

We assume

$$\mathbf{u} = \mathbf{u}_*$$
 on $\partial \Omega$

where \boldsymbol{u}_{*} is a given velocity satisfying the compatibility condition

$$\int_{\partial\Omega}\mathbf{u}_{*}\cdot\mathbf{n}\ d\boldsymbol{\gamma}_{\mathbf{x}}=\mathbf{0}.$$

Now, we can introduce the following operator called *Poincaré–Steklov operator*

$$\mathbf{\Lambda}_{\mathcal{S}}(\mathbf{u}_*) := \boldsymbol{\sigma}(\mathbf{u},p)n$$
 on Γ .

Our goal is to prove the injectivity of this operator, in the sense,

$$\boldsymbol{\sigma}\left(\mathbf{u}^{(1)},\boldsymbol{p}^{(1)}\right)\mathbf{n}_{|\Gamma} = \boldsymbol{\sigma}\left(\mathbf{u}^{(2)},\boldsymbol{p}^{(2)}\right)\mathbf{n}_{|\Gamma} \quad \Rightarrow \quad \mathcal{S}^{(1)} = \mathcal{S}^{(2)}.$$

(日) (日) (日) (日) (日) (日) (日)

Theorem (well-posedness)

Assume $\mathbf{u}_* \in \mathbf{H}^{3/2}(\partial\Omega)$, S_0 is a smooth non empty domain and assume $(\mathbf{a}_0, \mathbf{Q}_0) \in \mathbb{R}^3 \times SO_3(\mathbb{R})$ is such that $\overline{S(\mathbf{a}_0, \mathbf{Q}_0)} \subset \Omega$ and $\mathcal{F}(\mathbf{a}_0, \mathbf{Q}_0)$ is a smooth non empty domain. Then there exist a maximal time $T_* > 0$ and a unique solution

 $(\mathbf{a},\mathbf{Q})\in\mathsf{C}^1([0,T_*);\mathbb{R}^3 imes SO_3(\mathbb{R})), \quad (\boldsymbol{\ell},\boldsymbol{\omega})\in\mathsf{C}([0,T_*);\mathbb{R}^3 imes\mathbb{R}^3),$

 $(\mathbf{u},\boldsymbol{\rho})\in \boldsymbol{\mathsf{C}}\left([0,\mathcal{T}_*);\boldsymbol{\mathsf{H}}^2(\mathcal{F}(\boldsymbol{\mathsf{a}}(t),\boldsymbol{\mathsf{Q}}(t)))\times \mathcal{H}^1(\mathcal{F}(\boldsymbol{\mathsf{a}}(t),\boldsymbol{\mathsf{Q}}(t)))/\mathbb{R}\right)$

satisfying the previous system. Moreover one of the following alternatives holds:

(日) (日) (日) (日) (日) (日) (日) (日) (日)

• $T_* = +\infty;$

$$\lim_{t\to T_*} \operatorname{dist} \left(\mathcal{S}(\mathbf{a}(t), \mathbf{Q}(t)), \partial \Omega \right) = 0.$$

Let us take two smooth non empty domains $\mathcal{S}_0^{(1)}$, $\mathcal{S}_0^{(2)}$ and we consider $\left(\mathbf{a}_0^{(1)}, \mathbf{Q}_0^{(1)}\right)$, $\left(\mathbf{a}_0^{(2)}, \mathbf{Q}_0^{(2)}\right) \in \mathbb{R}^3 \times SO_3(\mathbb{R})$ such that $\overline{\mathcal{S}^{(1)}\left(\mathbf{a}_0^{(1)}, \mathbf{Q}_0^{(1)}\right)} \subset \Omega$ and $\overline{\mathcal{S}^{(2)}\left(\mathbf{a}_0^{(2)}, \mathbf{Q}_0^{(2)}\right)} \subset \Omega$.

Applying the previous theorem, we deduce that for any $\mathbf{u}_* \in \mathbf{H}^{3/2}(\partial\Omega)$, there exist $\mathcal{T}_*^{(1)} > 0$ (respectively $\mathcal{T}_*^{(2)} > 0$) and a unique solution $\left(\mathbf{a}^{(1)}, \mathbf{Q}^{(1)}, \boldsymbol{\ell}^{(1)}, \boldsymbol{\omega}^{(1)}, \mathbf{u}^{(1)}, \boldsymbol{\rho}^{(1)}\right) \left($ respectively $\left(\mathbf{a}^{(2)}, \mathbf{Q}^{(2)}, \boldsymbol{\ell}^{(2)}, \boldsymbol{\omega}^{(2)}, \mathbf{u}^{(2)}, \boldsymbol{\rho}^{(2)}\right)\right)$ of our system in $\left[0, \mathcal{T}_*^{(1)}\right) \left($ respectively in $\left[0, \mathcal{T}_*^{(2)}\right)\right)$.

Main results

Theorem (identifiability)

Assume that $\mathbf{u}_* \in \mathbf{H}^{3/2}(\partial \Omega)$ and that \mathbf{u}_* is not the trace of a rigid velocity on Γ . Assume also that $\mathcal{S}_0^{(1)}$, $\mathcal{S}_0^{(2)}$ are convex. If there exists $0 < t_0 < \min\left(T_*^{(1)}, T_*^{(2)}\right)$ such that

$$\pmb{\sigma}\left(\mathbf{u}^{(1)}(t_0),p^{(1)}(t_0)
ight) \; \mathbf{n}_{ert \Gamma} = \pmb{\sigma}\left(\mathbf{u}^{(2)}(t_0),p^{(2)}(t_0)
ight) \; \mathbf{n}_{ert \Gamma}$$

then there exists $\mathbf{R} \in SO_3(\mathbb{R})$ such that

$$\mathbf{R}\mathcal{S}_0^{(1)} = \mathcal{S}_0^{(2)}$$

and

$$\mathbf{a}_{0}^{(1)} = \mathbf{a}_{0}^{(2)}, \qquad \mathbf{Q}_{0}^{(1)} = \mathbf{Q}_{0}^{(2)} \mathbf{R}.$$

In particular, $T_{*}^{(1)} = T_{*}^{(2)}$ and $\mathcal{S}^{(1)}(t) = \mathcal{S}^{(2)}(t) \quad \left(t \in \left[0, T_{*}^{(1)}\right)\right).$

Main results

Idea of proof.

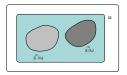

In order to prove Theorem of identifiability, we reason by contradiction and we assume that there exists $0 < t_0 < \min(T_*^{(1)}, T_*^{(2)})$, such that

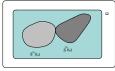

$$m{\sigma}\left({f u}^{(1)}(t_0), p^{(1)}(t_0)
ight) \,\, {f n}_{ert \Gamma} = m{\sigma}\left({f u}^{(2)}(t_0), p^{(2)}(t_0)
ight) \,\, {f n}_{ert \Gamma}$$

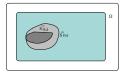

and $S^{(1)}(t_0) \neq S^{(2)}(t_0)$. In that case, since $S^{(1)}(t_0)$ and $S^{(2)}(t_0)$ are convex sets, we have

• $\partial \mathcal{S}^{(1)}(t_0) \cap \partial \mathcal{S}^{(2)}(t_0)$ is included in a line

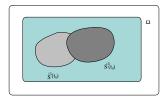

This case can be split into the 3 following subcases

• $\partial S^{(1)}(t_0) \cap \partial S^{(2)}(t_0)$ contains 3 noncollinear points.

By using the unique continuation result for the Stokes equations due to Fabre and Lebeau, we prove that neither of the above case may be possible. $\hfill \Box$
